ABOUT ME

Dedicated Software Engineer with 3+ YOE specializing in **Java backend** development, with a strong focus on Spring Boot and modern Java

SKILLS

- Java, Spring Framework, JPA/Hibernate, JDBC, OpenFeign.
- Oracle, PL/SQL , PostgreSQL, MySQL, Redis.
- Docker, Git, CI/CD pipeline, Swagger/OpenAPI.
- Microservice, REST, gRPC, RabbitMQ.
- Even-driven Architecture, DDD, Saga, Transactional Outbox, Pub/sub, Idempotency.
- AI Tools (ChatGPT, Copilot, etc.) and validate AI-generated outputs.

EXPERIENCE

VNPT-IT 09/2025 – 10/2026

Software Engineer (ONEBSS – module Telecom-service quality control)

Tech stack: Vue | Spring Boot | RESTful API | MinIO | Microservice | OpenFeign

- **Developed Domain-Driven Design** backend development for a core ERP domain using Spring Boot and Microservices, implementing advanced high-concurrency controls to ensure data integrity.
- Integrated (**MinIO**) and facilitated seamless inter-service communication using **OpenFeign** and RESTful APIs.
- Used **WebSockets** to solve the inefficiency of frequent client-side API requests from the Vue.js front-tend, resulting in a real-time push notification.
- Resolved race-conditions and concurrent update conflicts by applying **optimistic locking** mechanisms.

Software Developer (EBILL – Customer payment management)

TechStack: Springboot | Oracle | Vue | JasperReports | Hibernate

- Implemented user account creation and password management encryption, enabling secure two-way password storage/retrieval.
- Optimized queries and ensured transaction consistency under high concurrency by implementing **optimistic locking** mechanisms and resolving race conditions.
- Nomorlized Procedure and API legacy due to expand province ID changes and module migration.
- Handled Excel import/export to reset password and intergated service QR code links via SMS.

VNPT VinaPhone (TTKD) 03/2024 - 09/2025

Software Engineer (Report System)

Tech stack: Oracle | RabbitMQ | Redis | Spring Boot

- Refactored legacy PL/SQL queries by restructuring deeply nested joins into CTEs for readability, combined with local indexing on sub-partition keys.
- Built bulk import/export for files with up to 100K records using batch processing and periodic Hibernate session flush/clear to keep memory usage stable.
- Reduced redundant processing for 1M-row monthly reports by caching completed.
- Enforced idempotency via database-level unique constraints to prevent duplicate records when import requests are retried.
- accepted into the queue, protecting downstream processing from being overwhelmed by repeated

submissions.

- Used **RabbitMQ** to offload heavy data exports from the request thread.

TMA Solution 06/2023 - 01/2024
Software Engineer
Tech stack: React | Java8 | JDBC | Oracle

- Architected a mission-critical billing system for telecom services using Java and Spring Boot, leveraging **Spring JDBC** for high-performance data processing.
- Designed a Maven Multi-module monorepo to isolate core server logic, reporting engines, and API layers
- Refactored legacy SQL queries and logic to enhance throughput for massive historical energy data.

EDUCATION

Ho Chi Minh City University of Technology and Engineering **Graduated**: 04/2024
Major: Computer Engineering
